Node2 : entry gate

The screenshot shows the configuration for Node2, an "Event filter (entry gate)". The interface is divided into three main sections: INPUT, CONDITIONS, and OUTPUT.

- INPUT:** A tree view of the event data structure. It includes fields like `# timestamp`, `T webhookEvent`, `T comment`, `T self`, `T id`, `T author`, `T accountId`, `T avatarUrls`, `T displayName`, `T active`, `T timeZone`, `T accountType`, `T body`, and `T updateAuthor`.
- CONDITIONS:** A section for defining filter rules. It shows two conditions connected by an "OR" operator:
 - Condition 1: `[[ $json.webhookEvent ]]` is equal to `comment_created`.
 - Condition 2: `[[ $json.webhookEvent ]]` is equal to `jira:issue_updated`.
- OUTPUT:** A section for defining the output data. It currently shows "No output data" and a button to "Execute step to view output data".

The bottom of the screen shows a Windows taskbar with various application icons and a system clock indicating 12:52 on 03-02-2026.

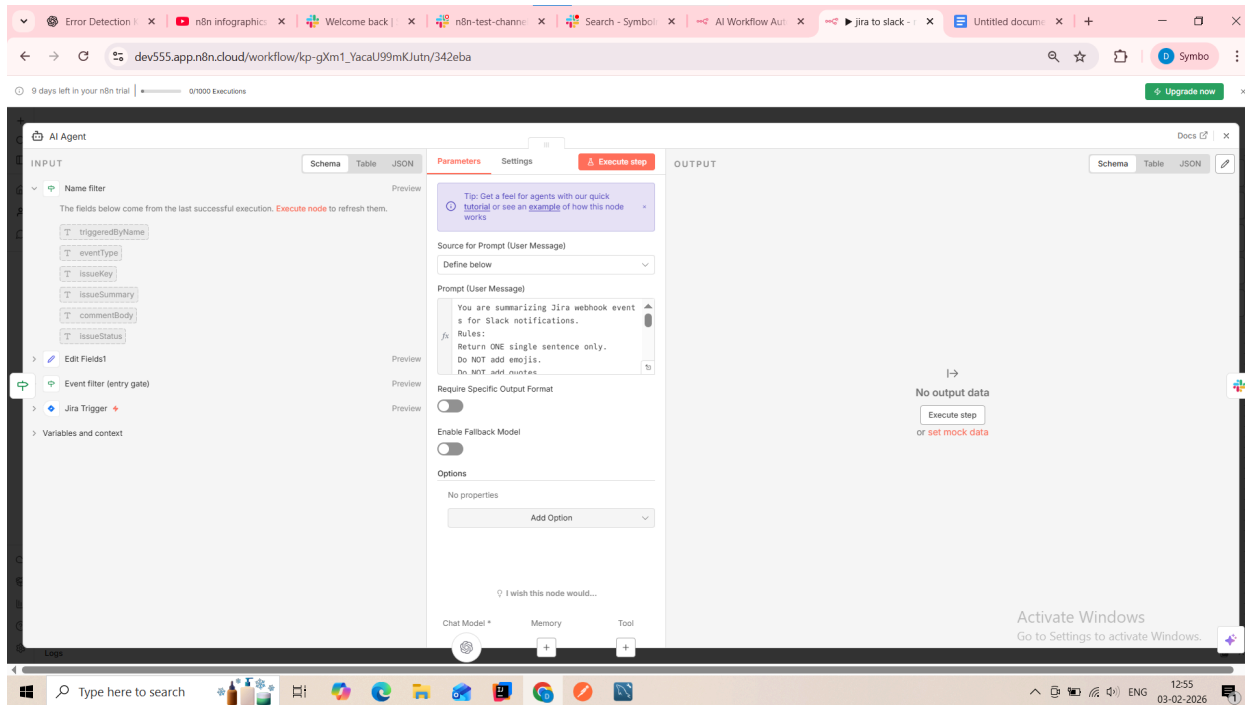

Node3: Edit fields

The screenshot shows the configuration for Node3, an "Edit Fields" node. The interface is divided into three main sections: INPUT, FIELDS TO SET, and OUTPUT.

- INPUT:** A tree view of the event data structure, identical to the one in Node2.
- FIELDS TO SET:** A section for defining fields to be updated. It shows three fields being set:
 - `triggeredByName`: Set to `[[ $json.comment?.author?.displayName || $json.user?.displayName || '' ]]`.
 - `eventType`: Set to `[[ $json.webhookEvent ]]`.
 - `issueKey`: Set to `[[ $json.issue?.key || '' ]]`.
- OUTPUT:** A section for defining the output data. It currently shows "No output data" and a button to "Execute step or set mock data".

The bottom of the screen shows a Windows taskbar with various application icons and a system clock indicating 12:53 on 03-02-2026.

Node 5 : ai agent

Prompt ;

You are summarizing Jira webhook events for Slack notifications.

Rules:

Return ONE single sentence only.

Do NOT add emojis.

Do NOT add quotes.

Do NOT add extra text.

If the event is a comment event (eventType contains "comment"):

Return:

New comment on <issueKey> by <triggeredByName>: <short summary>

If the event is NOT a comment event:

Return:

Issue Updated: <issueKey> - <issueSummary> (Status: <issueStatus>) by <triggeredByName>

Data:

Event type: {{\$json.eventType}}

Triggered by: {{\$json.triggeredByName}}

Issue key: {{\$json.issueKey}}

Issue summary: {{\$json.issueSummary}}

Comment body: {{\$json.commentBody}}

Issue status: {{\$json.issueStatus}}

Node 6: Send message (Slack)
